

ADEMOLA AFOLABI COLLINS

Full-Stack Software Engineer

Nigeria | afolabiademola27@gmail.com | +234 903 761 3598 | collynx.vercel.app | github.com/SlinkyCollins | [@collynxcodes](https://twitter.com/collynxcodes)

SUMMARY

Full-stack software engineer with 3 years of experience designing and shipping production-style web applications across fintech, recruitment, and simulation domains. Independently built and deployed four full-stack systems covering concurrent transaction processing, multi-provider authentication, RBAC, and containerized deployment. Computer Engineering graduate (LAUTECH, 2026) with a consistent record of taking projects from architecture through to public deployment, not just coursework completion. Seeking an entry-level software engineering role to build scalable web applications and solve real-world engineering problems.

TECHNICAL SKILLS

Languages: JavaScript, TypeScript, PHP

Frontend: Vue 3, React, Angular, Next.js, Tailwind CSS, PrimeVue, Pinia, Redux Toolkit

Backend: Laravel, Node.js, REST API Design, Swagger/OpenAPI, Sanctum Auth

Databases: MySQL, MongoDB

Tools & Deployment: Docker, Vercel, Render, Git/GitHub, Firebase Auth, Cloudinary, Vite, Postman

Core Concepts: Authentication & RBAC (JWT, OAuth), Concurrency Control, State Management, Data Integrity, API Integration

PROJECTS

Vaultly — Digital Banking System | *Vue 3, Pinia, PrimeVue, Laravel 12, MySQL, Sanctum, Cloudinary*

Built to explore transactional integrity, concurrency handling, and secure financial operations in a digital banking system.

[Live Demo](#) | [GitHub](#)

- Built and deployed a 13-page full-stack banking application backed by a 21-endpoint Laravel REST API covering auth, deposits, withdrawals, transfers, beneficiaries, and profile management
- Engineered concurrency-safe transaction flows using DB transactions and row-level locking, validated across concurrent-transfer test scenarios that confirmed zero double-spend conditions
- Deployed a production-ready architecture across 4 cloud services (Vercel, Render, Aiven MySQL, Cloudinary) — from first commit to production in 4 weeks

JobNet — Global Recruitment Platform | *Angular 18, PHP 8.2, MySQL, Firebase Auth, Docker, Swagger/OpenAPI*

Built as a capstone-style project to explore real-world authentication, role-based authorization, and scalable full-stack architecture.

[Live Demo](#) | [GitHub](#)

- Built a full-stack recruitment platform with 61 REST API endpoints, 31 Angular pages, and 3 role-based dashboards (Job Seeker, Employer, Admin)
- Designed a hybrid authentication pipeline combining Firebase OAuth with MySQL-backed accounts, supporting email/password and multi-provider social login linking
- Implemented salary normalization across 4 currencies (USD, GBP, EUR, NGN); containerized the backend with Docker and documented all endpoints via Swagger/OpenAPI

NairaNest — Core Banking Infrastructure | *React, Redux Toolkit, Node.js, MongoDB, Material UI, JWT*

Built to implement secure, real-time money-transfer workflows and a modern financial dashboard experience in a full-stack application.

[Live Demo](#) | [GitHub](#)

- Built a banking platform exposing 21 REST API endpoints backed by 3 MongoDB data models and 14 production-style banking features
- Engineered atomic balance transfers using MongoDB transactions, keeping sender balances, recipient balances, and transaction records synchronized under failure conditions
- Secured the application with JWT authentication, RBAC, and protected routes across 8 security features, validated across 10+ authentication edge cases

Phone OS Simulator — Browser-Based Mobile OS | *Vanilla JavaScript, HTML5, CSS3, Canvas API, Webcam API, LocalStorage*

Built to deepen JavaScript fundamentals by recreating a smartphone experience from scratch without frontend frameworks, focused on browser APIs and app architecture.

[Live Demo](#) | [GitHub](#)

- Built a browser-based mobile OS simulator with 10 interconnected applications using vanilla JavaScript — zero frontend frameworks
- Implemented 5 persistent LocalStorage-backed modules managing contacts, messages, airtime balance, voucher cards, and call history across sessions
- Integrated 4+ browser APIs (Canvas, Webcam) for a working camera and mini-game; simulated telecom workflows across 4 Nigerian mobile networks with USSD recharge validation and call billing

ACHIEVEMENTS & CONTINUOUS LEARNING

- Shipped 100+ REST API endpoints across four independently deployed, production-style full-stack systems spanning fintech, recruitment, and simulation domains
- Maintain 40+ public repositories on GitHub spanning full-stack frameworks, DSA, and independent builds — reflecting consistent, hands-on shipping habits
- Completed a structured 6-level SQL full-stack program (Vue, Laravel, MySQL, DSA) and the HNG11 Software Internship (Stage 1: JS/DOM APIs; Stage 2: React, component architecture)

EDUCATION

B.Tech, Computer Engineering — Ladoke Akintola University of Technology (LAUTECH), Nigeria — Graduated 2026
